With TVI

- A Right-sided hemiparesis secondary to left internal carotid artery occlusion, progressing to cerebral herniation with fatal outcome.
- B Hypoactive delirium and watershed infarction involving the ACA/MCA and PCA territories, resulting in tetraparesis.
- ▲—▲ C Hyperactive delirium.
- ◆—◆ D Left-sided hemiparesis with right-sided hemispatial neglect.
- ▼—▼ E Recurrent generalised tonic-clonic seizures.
- +—+ F Hyperactive delirium complicated by haematoma and haemothorax requiring surgical evacuation.

- ✕—✕ G Severe hyperactive delirium with risk of self-harm and harm to others, necessitating re-sedation.
- ★—★ H Hyperactive delirium.
- ◀—▶ I Hypoactive delirium with somnolence.
- ▶—▶ J Left-sided hemiparesis without identifiable radiological correlate.
- K Transient ischaemic attack with subtle motor deficit and left-sided hemispatial neglect, accompanied by mild delirium.
- L Left-sided hemiparesis due to M3–M4 segment occlusion without interventional target, accompanied by delirium.
